Murders and Maggots

Gail Anderson

Forensic entomology is the study of insects associated with a dead body in order to estimate the elapsed time since death. This talk will explain how insects can be used to estimate time of death, as well as other factors such as position and presence of wounds, and analysis of poaching cases. True case histories will be used to illustrate the science.

Sat, Oct 26, 2013

10am – 12pm

The Forum, main floor,
Parksville Civic & Technology Centre,
100 Jensen Avenue, Parksville
